Introduction

The goal of this document is to present the user requirements, mentioning possible user stories, going through functional, non-functional and technical requirements. It also contains the MoSCoW requirements prioritization method, used to ensure that core requirements are met, while less important ones (secondary) could be later realized (postponed).

Targeted users

External stakeholders

- Local community: Locals could benefit from temporarily renting a car for their personal needs.
- Tourists agencies: Those agencies who are offering rental options for a vehicle to tourists to explore the surroundings, reach their distant hotels.
- Hotels agencies: Individual hotels offering renting a car to their hosts.
- Car manufacturers/retailers: Retailers promoting their cars through rental companies to clients.
- Business: Other businesses renting significant number of cars to enlarge their business needs (e.g. restaurants, takeaway).

Functional requirements

Administrative control

Authenticated users could access an external panel (dashboard) for managing the cars within a service point. The operations that user could perform are:

- Create: Adding new car models to the system, gallery of cars, service places.
- Read: Monitor all the details per car, service location data.
- Update: Change details of cars, pick-up/drop off locations.
- Delete: Delete certain models from the system (soft delete), car service details like service name, location.

Customers

All customers being able to rent one or multiple cars with options:

- Search: Search for different brands, car location services.
- Book: Able to rent a car/s and choose a pick-up/drop off point.
- Account: Each customer has its own related account, where different details like rented car, pick-up/drop off time and location.

User stories
