## **Introduction**

This document is about my personal reflection on this assignment, feedback retrospection, what new things did I learned and old things I brushed on.

## **Reflection**

This assignment made me put my pre-knowledge in C# into test. It not only made me to brush up on some C# syntax but also train my algorithmic thinking.

### **Feedback 1:**

From this feedback I was recommended to optimize the code had already and to think in a more abstract, modular way.

### **Feedback 3:**

After improving my current implementation, I ran into a problem that my program would only work for a certain condition, which was even number of pairs. That made me reconsider more extensively the test part (test with different inputs before presenting your solution).

### **Feedback 4:**

Finally, I came up with a working solution. The program got tested for ensuring that it works for different conditions and I was shown a more robust way to ensure that my data is protected. That made me focus on privacy measures.

## **Conclusion**

Overall, the problem was interesting with some dose of challenge, making me rethink several times my implementation as well during that time I also learned new things.
